## ❖ Description

Due to the scarcity and high prices of Telegram Airdrop bots, we have decided to develop the VW Airdrop Bot. The initial version is introduced with support for the BNB Smart Chain network (Bep20), but with minor changes, it can also support other networks such as Fantom, Ethereum, Polygon, etc. Support can be changed upon request from the buyer. VW is an Airdrop bot with instant withdrawal and high customization capabilities, as well as 24/7 support that is responsive to your needs in any field.

## ❖ Data

The database used for this project is SQLite; which is completely free and can be used easily in any system.

- What is SQLite ?

SQLite is a C-language library that implements a small, fast, self-contained, high-reliability, full-featured, SQL database engine. SQLite is the most used database engine in the world. SQLite is built into all mobile phones and most computers and comes bundled inside countless other applications that people use every day. More Information...

The SQLite file format is stable, cross-platform, and backwards compatible and the developers pledge to keep it that way through the year 2050. SQLite database files are commonly used as containers to transfer rich content between systems and as a long-term archival format for data. There are over 1 trillion SQLite databases in active use.

SQLite source code is in the public-domain and is free to everyone to use for any purpose.

## ❖ Customization

All values and texts of the bot can easily be changed by the admin through the Config file or Panel command. Full customization of the bot is one of its important features. However, for complete changes to some basic texts, minor modifications to the source code are required, which our support team provides for free and very quickly for buyers.

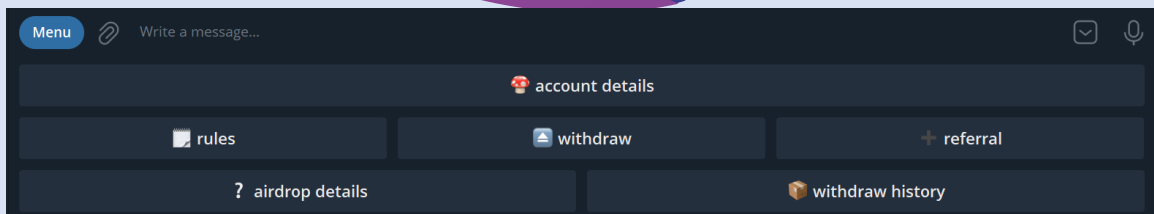

## Commands

List of commands for users:

Start; Account Details; Airdrop Details; Rules;  
Withdrawal; Withdrawal history; Reset wallet;  
Referral.

And the panel command is only available for  
admins.

The images show the function of each command:
